DEFINICIÓN DE DISEÑADOR DE INTERIORES

Es un PROFESIONAL que provee un SERVICIO.

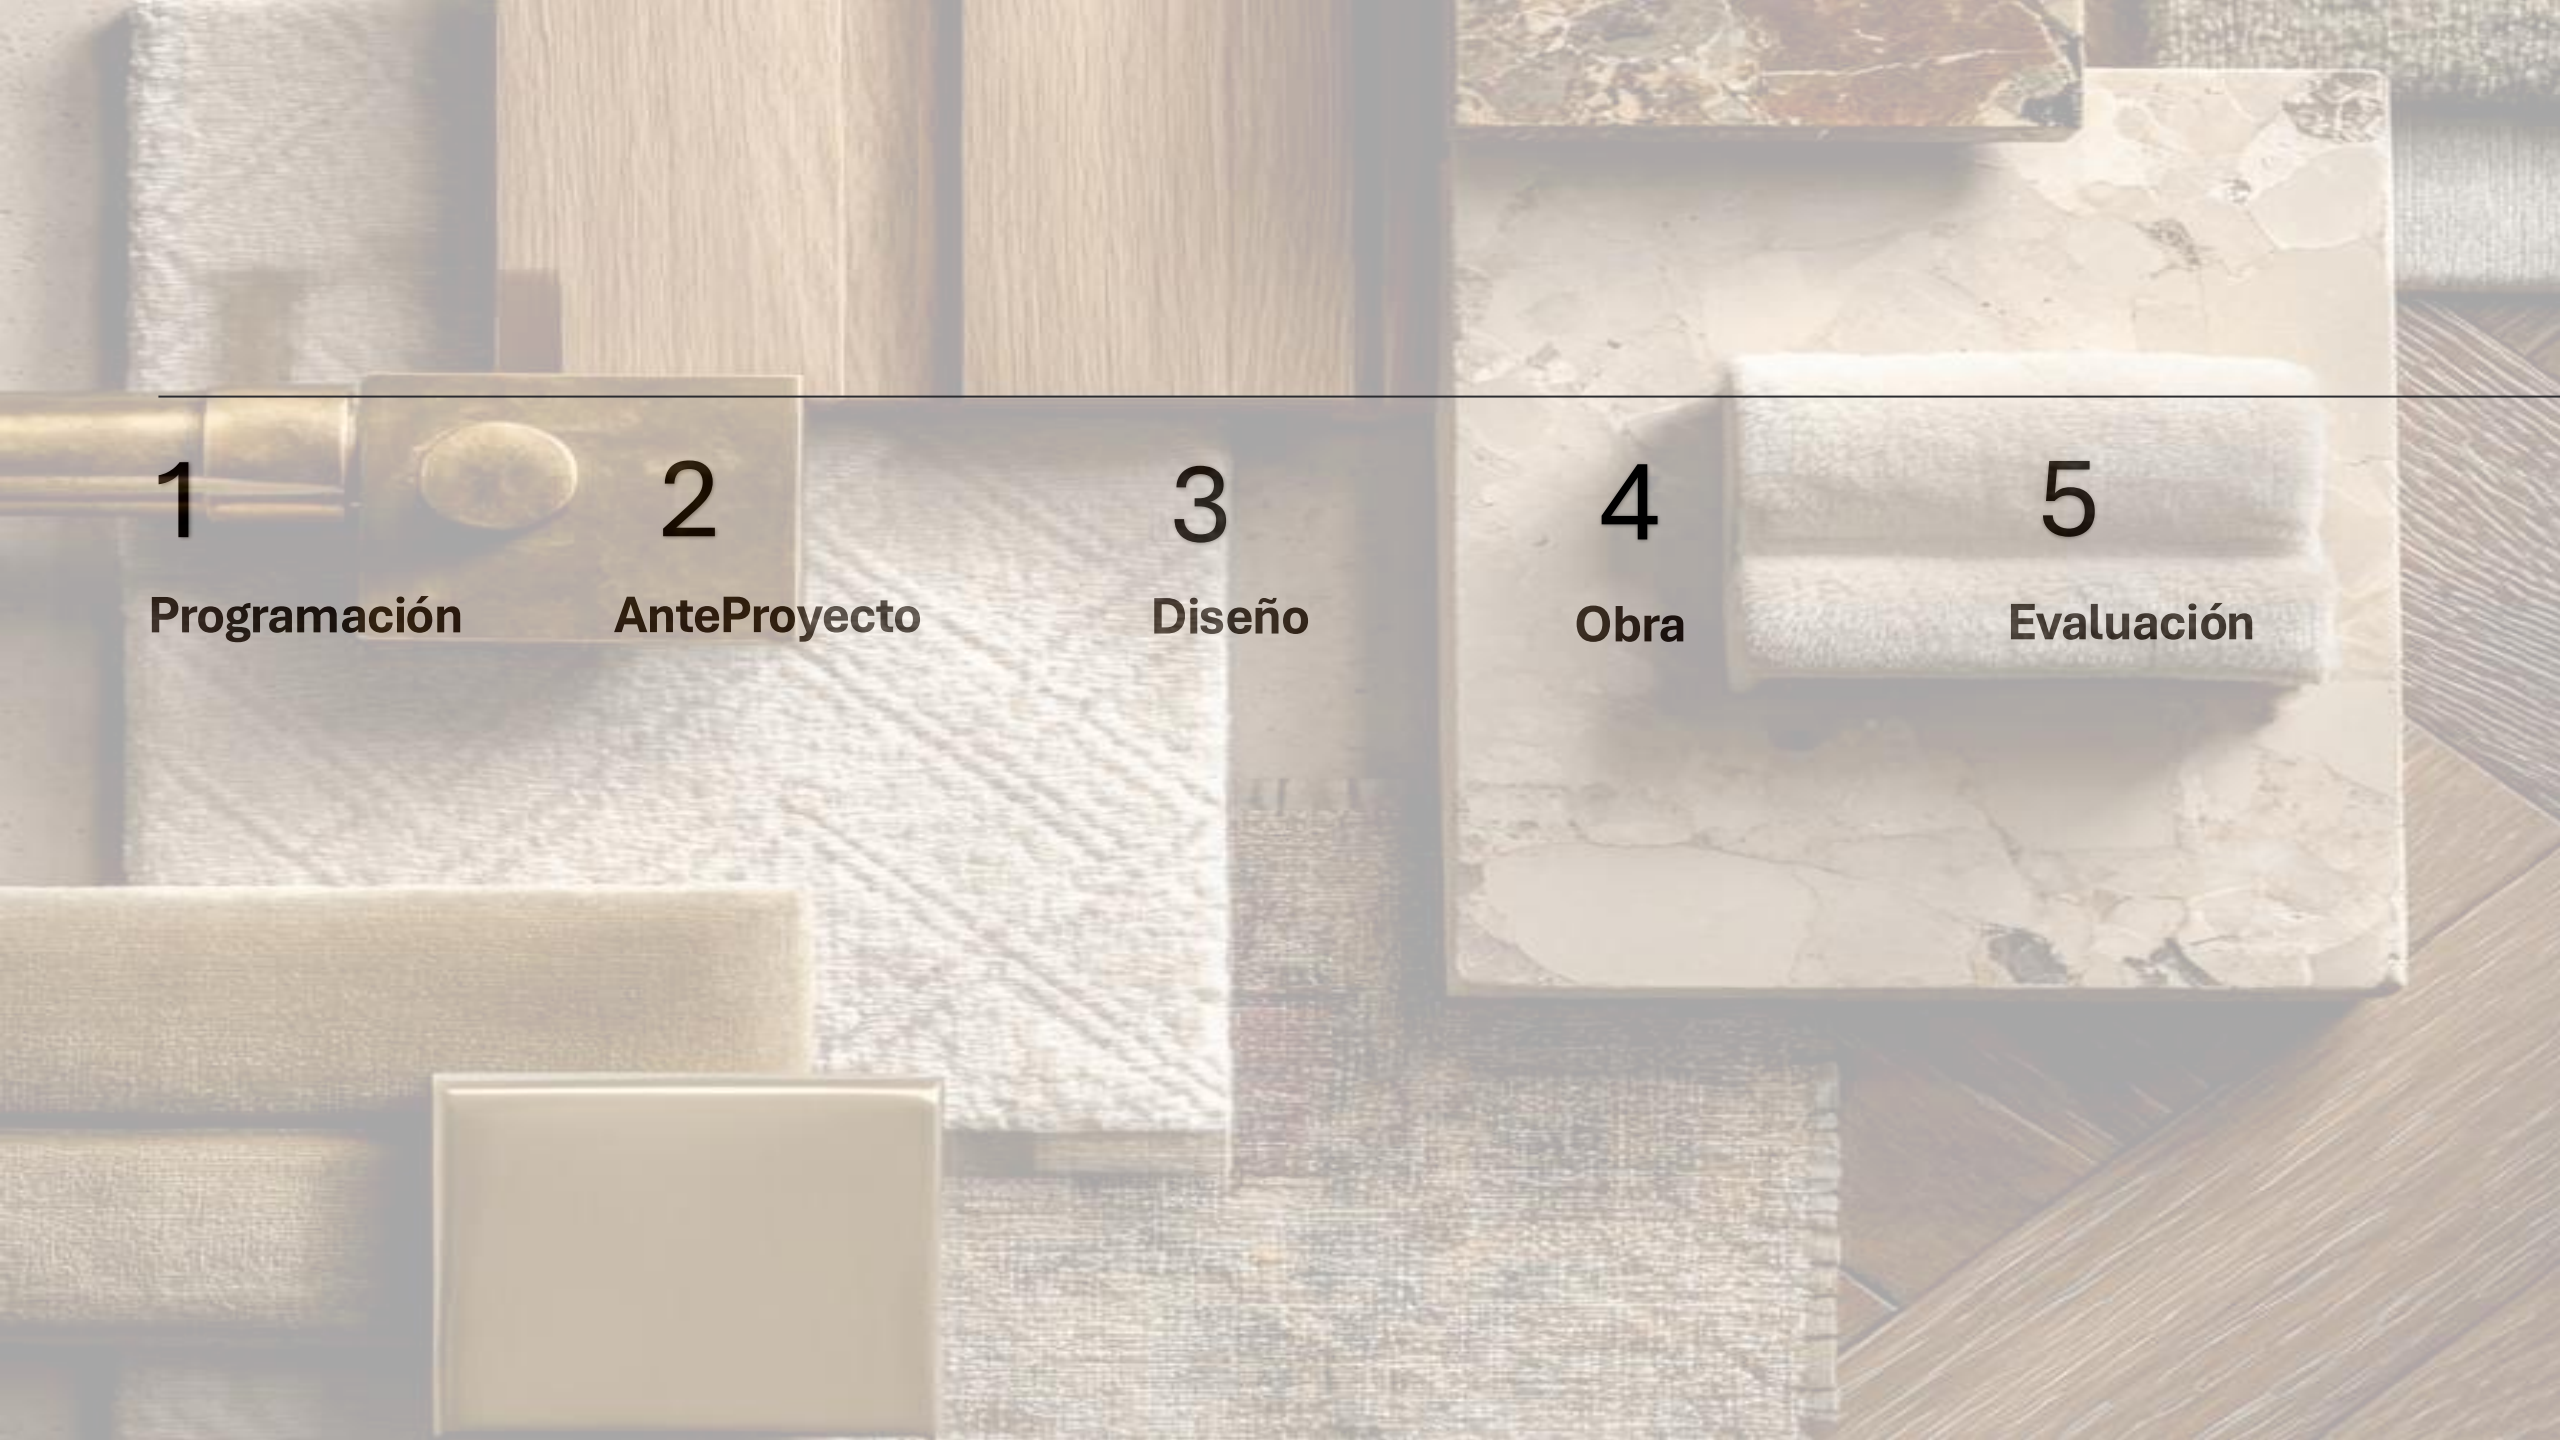

Un diseñador de interiores es un profesional que traduce necesidades humanas en espacios habitables, funcionales y emocionalmente significativos.

Piensa, proyecta y construye experiencias espaciales. Crear entornos que mejoran la vida de las personas.

Cumple función social: genera espacios de reunión. Impacta en la calidad de vida.

Para desarrollar su actividad procede con orden, usa una METODOLOGIA.

Basado en el Pensamiento de diseño

**GOOGLE'S TOP AI SCIENTIST SAYS
THE NEXT GENERATION'S MOST NEEDED
SKILL WILL BE 'LEARNING HOW TO LEARN'**

Most designers assume

AI-generated interiors look fake.

They do if you don't know
how to control your prompt.

The difference now **isn't the tool.**

It's what you put in.

Generic prompt → generic result.
Real brief → your project.

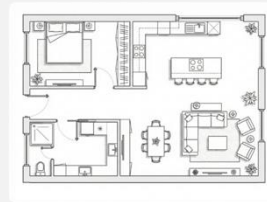

The line between AI renders
and professional photography
is becoming harder than ever to spot.

I then generate
concept visuals
based on the brief

That direction becomes visuals. Multiple
directions, multiple moods in just a few minutes.

LAYOUT_OPTION 1

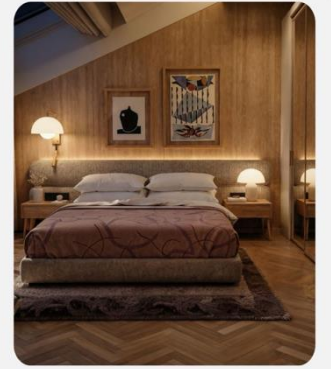

LAYOUT_OPTION 2

Quickly test new color variants
with different color palettes

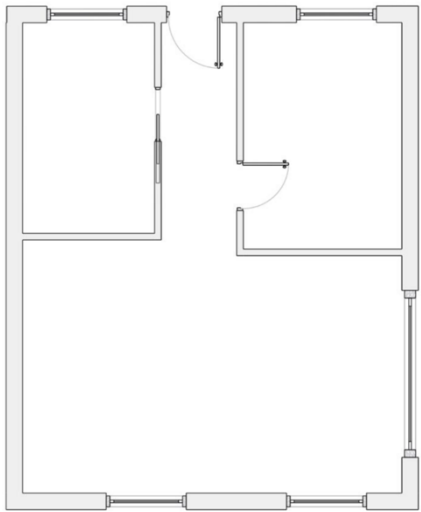

Annotated infographic

Change the lighting condition
from daytime to golden hour to night

workflow with AI

And I'm sharing it with you for free

Furnish your empty floorplan

Get multiple layout ideas to better understand
how your space can be arranged.

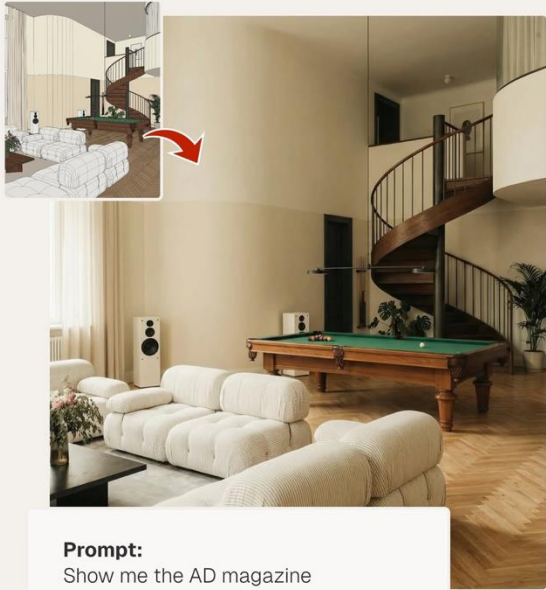

Stylize your 2D floorplan
Style your 2D floorplan and control the
materials used in each area

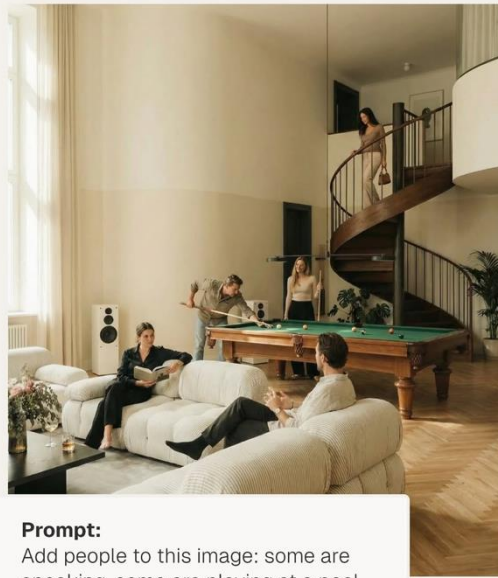

From 2D to 3D Render
Generate a 3D render from
your 2D floorplan

Create multiple camera angles
of the same space

Prompt:
Show me the AD magazine
photography version of this image.

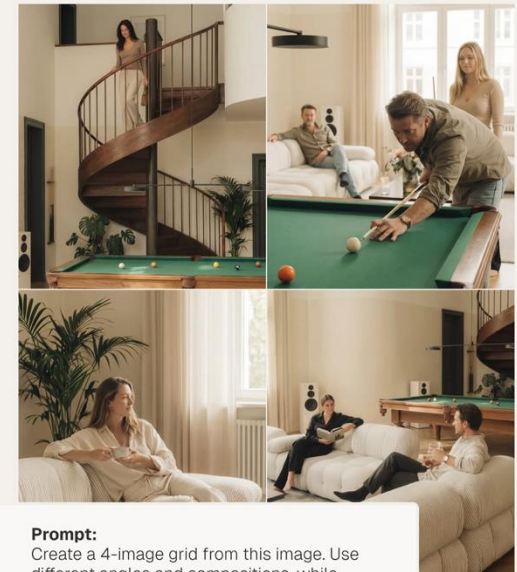

Prompt:
Add people to this image: some are
speaking, some are playing at a pool
table, and a woman walks up the stairs.

Upscale the image you want

Prompt:
Upscale this image in 4K, ultra detailed
photography.

Prompt:
Create a 4-image grid from this image. Use
different angles and compositions, while
maintaining a cohesive visual style. focus on
people.

A professional interior design presentation board layout for [NAME OF THE PROJECT]. The board should have a clean, minimalist aesthetic with a solid white background.

Layout Structure:

Top Left (Header & Concept): A large, bold title: '[NAME OF THE PROJECT]'. Below it, a 'Header & Concept' section featuring a minimal moodboard summary, and a brief text block under the heading 'Client Need'.

Center (Isometric View): The main visual focus: a highly detailed, furnished 3D isometric cutaway floor plan of a modern, minimalist [Apartment]. This plan should feature thin callout lines pointing to specific elements with technical text labels.

Top Right (Technical & Material Details): Main heading 'Technical & Material Details'. Below it, a minimalist 2D floor plan. Under the floor plan, 2D interior elevation wireframe drawings of key walls

Bottom Left (Furniture): A 'Furniture' section featuring 4 horizontal photorealistic furniture images side-by-side: with their names underneath.

Bottom Right (Material Board & Project Info): A 'Material Board' section featuring 6 circular swatches of the project's materials

Overall Style: Architectural layout, precise drawings, highly organized UI/UX grid style, photorealistic renders mixed with technical drawings, soft natural lighting on the 3D elements, hyper-detailed, 8k resolution.

What realistic visuals are costing you right now...

Most of you have probably never thought about the cost of producing renders. For example:

- ✗ Enscape, Lumion, Twinmotion or V-Ray subscription (\$700-\$5,000/year depending on how many you pay for)
- ✗ Outsourced renders (\$500-\$2,000+ per project plus days or weeks turn around time)
- ✗ Outsourced product modelling for furniture you can't find in the 3D warehouse (\$100-\$300 per item)
- ✗ Hours of your time and/or your staff's time working inside rendering engines (not to mention the time waiting for exports!)
- ✗ Random AI subscriptions you signed up for and don't use properly

Some of this sits in invoices or bills and is obvious, but the rest is hidden inside staff time e.g. a junior designer spending 10 hours on a render is not free!!

The other hidden cost

There's also a hidden cost for the A&D practices that don't do renders or visuals at all.

Those practices pay in a different way.

For example with...

- Weaker proposals (that prospects are directly comparing with your competitors)
- Lower perceived value to clients
- More client hesitation and slower approvals
- Less confidence charging proper fees

These show up in lost revenue and lost trust.

The new opportunity

In the last few months AI rendering has made HUGE improvements.

This provides your practice with an opportunity to reduce the thousands of dollars you currently spend on rendering to almost nothing.

Are the AI renders as good manual renders? Not quite.

But can clients tell the difference between a render generated by AI and one that you spent \$2,000 on? Probably not.

Realistic visuals no longer need to be reserved for high budget projects. With the right workflows you can now create really good client facing renders for almost no money (and within a few minutes).

With the state of the economy right now you should be thinking about this as a commercial decision and trying to be as frugal as you can with expenses. AI rendering presents an opportunity for that.

Let's look at an example

This was a render that I outsourced for hundreds of dollars and took a few weeks to turn around (after changes etc)

This was one that AI created for me from my SketchUp image and my controlled workflows in about 2 minutes

Is it as good? No. But it's 90% of the way there and your clients won't be able to tell the difference. They will be just as "wowed" by the second one as they would be by the first.

AI should be across your entire team

Many of you have one or two “AI curious” people in your practices right now.

But don’t let AI just sit with that person. Your aim should be to start to think about how your practice can become “AI first” at every level.

That means empowering your team to use it every day and on as many of their daily workflows as possible.

AI rendering is one of those opportunities.

If any of this makes sense for you, here’s how to do something about it:

Step 1: Add up what you currently spend each year on rendering (subscriptions + outsourced work + staff time inside rendering engines). Most of you will be shocked when you do the maths.

Step 2: Pick one project you'd normally outsource or render manually and test running it through a controlled AI workflow instead.

Step 3: Build those workflows into your practice's standard process so AI rendering becomes a repeatable system, not a one-off experiment.

Step 4: Train your team so this becomes part of how the practice operates, not just a side project for the one “AI curious” team member.

If you want help with steps 2, 3 and 4 then join me in my new AI rendering program. Comment RENDER and I’ll send you some info. It’s currently 40% off for launch.

The maths is simple

Here's the ROI of implementing AI rendering workflows:

- 💥 One outsourced render avoided is \$500-\$2,000
- 💥 One software subscription you can cancel is \$700-\$1,000 per year
- 💥 One product modelled with AI instead of offshore is \$100-\$500
- 💥 10 hours of junior designer time saved each month is thousands a year
- 💥 One extra client converted because your pitch looked better is potentially hundreds of thousands in fees (depending on what you charge)

Basically one project modelled via AI instead of the above methods earns its money back many times over.

La misión primero era simple: ganar confianza con las herramientas esenciales de IA que todo diseñador necesita. Ya esta esa base que tantos otros todavía persiguen.

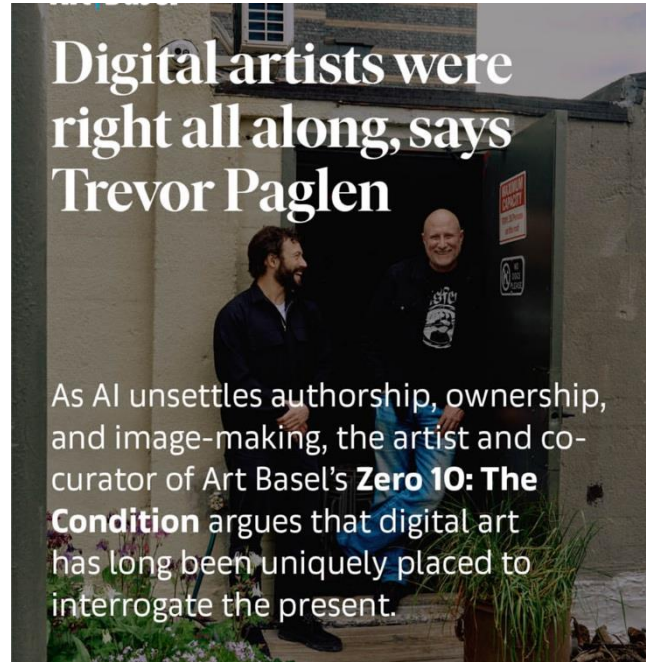

Los verdaderos avances no vienen de aprender una herramienta más. Llegan cuando conectas los puntos, cuando todo funciona en conjunto como parte de un sistema único y elegante que atraviesa todo tu proceso de diseño.

Esa realización lo cambió todo. Sabía que tenía que construir un camino claro.

No se aprende, se entena.
Se practica

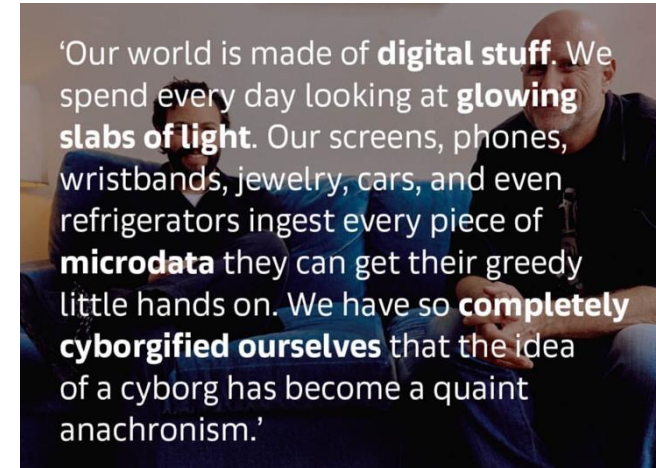

‘Caravaggio would have murdered someone for a copy of Photoshop. Leonardo would have done far worse for a Claude Code subscription. Artists use whatever it takes.’

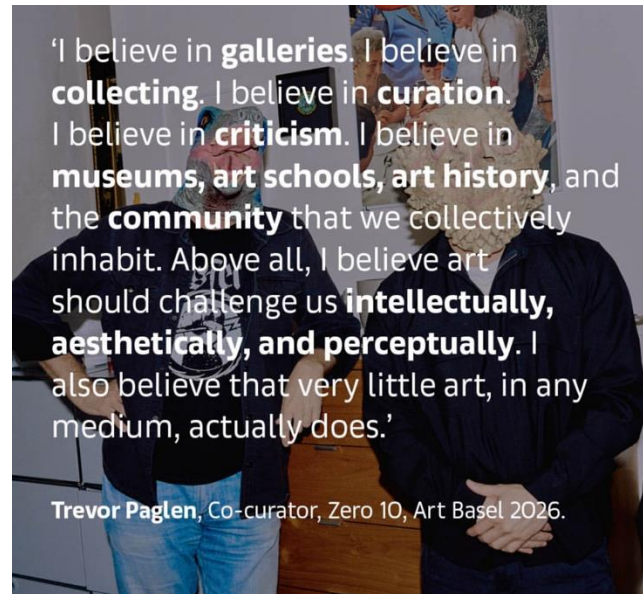

Digital artists were right all along, says Trevor Paglen

As AI unsettles authorship, ownership, and image-making, the artist and co-curator of Art Basel’s **Zero 10: The Condition** argues that digital art has long been uniquely placed to interrogate the present.

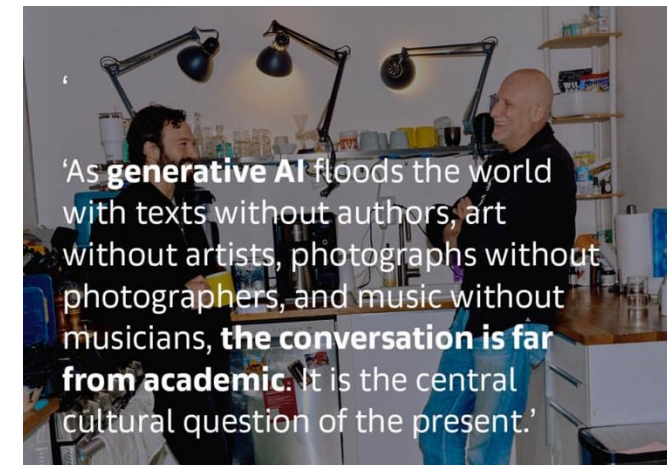

‘Our world is made of **digital stuff**. We spend every day looking at **glowing slabs of light**. Our screens, phones, wristbands, jewelry, cars, and even refrigerators ingest every piece of **microdata** they can get their greedy little hands on. We have so **completely cyborgified ourselves** that the idea of a cyborg has become a quaint anachronism.’

‘I believe in **galleries**. I believe in **collecting**. I believe in **curation**. I believe in **criticism**. I believe in **museums, art schools, art history**, and the **community** that we collectively inhabit. Above all, I believe art should challenge us **intellectually, aesthetically, and perceptually**. I also believe that very little art, in any medium, actually does.’

Trevor Paglen, Co-curator, Zero 10, Art Basel 2026.

‘As **generative AI** floods the world with texts without authors, art without artists, photographs without photographers, and music without musicians, **the conversation is far from academic**. It is the central cultural question of the present.’

La fotografía iba a matar a la pintura.

Luego lo digital iba a matar lo tradicional.

Después la IA empezó a generar imágenes en segundos.

Y, sin embargo, los pintores siguen vendiendo sus obras por mucho dinero.

Porque nadie estaba comprando las pinceladas.

Estaban comprando al artista.

Entonces, si las habilidades técnicas ya no valen nada, ¿qué queda?

Lo mismo que quedó para los pintores.

El diseño funciona igual.

La gente querrá trabajar con un diseñador por su gusto, su reputación y su estilo.

Por esa firma personal que se reconoce apenas uno entra en una habitación.

Y, siendo sinceros, también porque tiene cierto prestigio decir que trabajaste con esa persona.

La misma razón por la que alguien compra un Porsche cuando un Renault Clio lo lleva perfectamente al trabajo.

El Clio cumple la función.

El Porsche comunica algo.

Por eso los diseñadores deberían enfocar su energía en otro lugar.

No en intentar superar a la máquina.

Esa es una batalla imposible y la diferencia solo seguirá creciendo.

Construí la parte de tu trabajo que no depende de la habilidad técnica.

Tu punto de vista.

Tu nombre.

El cuerpo de trabajo con el que las personas te identifican.

Cuanto más inteligente sea la IA, más valioso será eso.

Cuando cualquiera pueda producir el trabajo, lo único que quedará para elegir será **quién** lo hizo.

The "experts" gave their opinions

@egg_oni

I'm disappointed I have to even point it out. There is no cohesion to the depth and color choices. The reflection of the tree bleeds into the lily pads with no regard for spatial depth or contrast. The background lily pad-algae amalgam is egregiously vague, like most AI art.

Charles Deskins
@jordox

the reflection in AI art is just noise splattered right. monet actually understood how light behaves on water

Chief Yeti
@0xchiefyeti

The choice of color in places e.g. the purple around the lily pads sticks out to me as decidedly worse than most Monet. I get a sense that the artist failed to connect their eyes to the brush/palette, almost as if...

Robert J...
@robertjett_

no frame, no sense of the threshold between subject and object, just colors

@SHLOMS

Automated by @s8n

i just generated an image in the style of a Monet painting using AI

please describe, in as much detail as possible, what makes this inferior to a real Monet painting

Ardiel @RDL0013 · 4h

Replying to @SHLOMS

The fact that it looks like shit and is shit. Slop. Doesn't look anywhere near like a Monet. Looks exactly like somebody trying to replicate the style and achieving like 20% of it. Not as vibrant as Monet's typical choice of colors. Looks dull.

Amal Dorai
@amaldorai

I'm no artist but a real Monet actually looks like a real place... the further back you get in this picture the less it looks like anything at all

Margot
@para_din3

Depth, contrast, and cohesion are the most obvious. There's also no clear focal point.

Azuri
@AzuriSplashes

Sure. It feels less lively. It lacks the texture, the rugged edges, the folds, the crevices and creases and bevels and topology of plastic arts. The fine, calculated highlights. The AI version is granulated pixelation, and it looks that way, it lacks the mess of humanity.

4/8

cottondog
@cottondog

Fair warning before I dig in: this image is actually a very competent rendition. It's doing more right than most AI Monet pastiches. But you asked what makes it inferior to a real Monet, so here's the honest breakdown.

What's missing — the physical object

A real Monet is a thing before it's an image. This is the biggest gap and it's not solvable by better prompting.

No impasto. Monet loaded paint thick. His water lily pads sit physically on top of the canvas — you can see the ridges where the brush dragged, the little peaks where pigment piled up. Look at the lily pads in your image: they're smooth tonal gradients pretending to be brushstrokes. A real one would catch light differently from the water around it.

No canvas weave. Monet painted on linen with a specific tooth that broke up his strokes and let underlayers peek through. Your image has a uniform digital surface — the "texture" is illusionistic, painted into the pixels rather than emerging from the substrate.

No drying history. Real Monets have cracks, areas where wet-into-wet bled, areas where dry paint was scumbed over dry paint. Pigments aged differently — his cobalt blues shifted, his madder lakes faded. The image has no chronology in it. It's all painted "at once."

What's wrong with the marks themselves

Brushstroke direction is decorative, not descriptive. Monet's strokes do work — vertical strokes for reflections of vertical things (drooping, rivet), horizontal strokes for the water surface, elliptical strokes that physically describe the floating disc of a lily pad. In your image, the strokes are stylistically "Monet-ish" but they don't consistently track what they're depicting. The reflections in the upper left, for instance, have stroke directions that don't quite resolve into specific reflected objects.

No hierarchy of finish. Monet had passages of intense detail next to passages left almost raw. He'd finish a single lily blossom with three decisive touches and leave a whole quadrant of water as scumbled understatement. AI tends to "render everything at the same level of "doneness." Your image is uniformly busy.

Edges are too soft everywhere. Real Monet has surprisingly hard edges in places — the rim of a lily pad against dark water can be a single confident knife-edge stroke. AI defaults to blending. Look at the pads in your foreground: their edges dissolve gradually. Monet's often don't.

The color problem

The palette is plausible but generic. Monet's late Giverny palette was specific and slightly weird: viridian, cobalt violet, French ultramarine, cadmium yellow, vermilion, lead white. The unusual one is the violet — he used cobalt violet aggressively and it shows up as shadows where you wouldn't expect it. Your image has some purple in the lily pad rims, which is the right instinct, but the violets aren't doing structural work the way Monet's do.

No optical mixing. Monet placed unmixed complementary colors next to each other so your eye blends them at viewing distance. Pure orange next to pure blue, reading as a luminous neutral. Your image has colors that are already pre-mixed into harmonious mid-tones. It's pleasant but it doesn't vibrate.

The whites are wrong. Monet's whites are almost never white — they're tinted pink, blue, lavender, yellow depending on the light condition he was chasing. The white lily in your upper-left is closer to a true neutral white than Monet would ever paint.

The conceptual gap

This is the part that actually matters and the part no model will close.

Monet was solving a problem. Each canvas in the Nymphs series is an answer to a specific question: what does this pond look like at 7am in August? What happens to reflections when wind crosses the surface? The paintings are records of sustained looking at a real place he built and tended for thirty years. Your image is a style reference, not an observation. It's a painting of "a Monet" rather than a painting of a pond.

No series logic. A single Monet water lily painting is meaningful partly because of the ~250 others. They're variations against each other. This image is an orphan — it has no relationship to anything.

No hand, no decision, no risk. Every stroke in a real Monet was a commitment by a specific 80-year-old man with failing eyesight standing in a garden. The image has no author in that sense. The "decisions" are statistical averages of millions of images. What it does get right (worth saying)

The compositional asymmetry is good. The reflected vertically reading as trees/trees is a smart move. The pink lilies in the lower foreground are placed with reasonable intuition. If you cropped tightly to a 6-inch square anywhere in this image, it would pass a quick glance.

The tell is always scale and surface. Stand six inches from a real Monet and it dissolves into chaos — slabs of pigment that look like nothing. Stand six inches from this and it just looks like a slightly blurrier version of itself. That collapse-into-chaos up close is the thing you can't lose without pain.
